

## PIEDMONT SURGICAL CLINIC SURGICAL EXPERTISE AND COORDINATED CARE FOR BREAST DISEASE.

The Piedmont Surgical Clinic surgeons have performed thousands of breast procedures and have decades of combined experience in treating breast disease. Our surgeons evaluate and treat a wide variety of breast conditions, including:

- Benign problems such as cysts, fibroadenoma or skin lesions
- Breast symptoms, including nipple discharge and breast pain
- DCIS (ductal carcinoma in situ), breast cancer that starts in the ducts that move milk from the breast to the nipple
- LCIS (lobular carcinoma in situ), areas of abnormal cell growth that increase the risk for invasive breast cancer
- All breast cancers, including ductal carcinoma in situ, inflammatory breast cancer and Paget's disease

Our surgeons understand the importance of a multidisciplinary approach, particularly for breast cancer patients. They coordinate with other medical specialists, including radiologists, medical oncologists, genetic counselors and radiation oncology specialists. Often, the general surgeon takes a lead role in the initial care of breast cancer patients,

because surgery is commonly the first line of treatment.

In addition to surgery, The Piedmont Surgical Clinic surgeons plan and perform many types of breast biopsy procedures. For breast cancer patients, our surgeons routinely perform sentinel lymph node biopsy. This advanced technique is used to stage breast cancer and can improve the accuracy of diagnosis and treatment.

If you have a breast disease or your physician wants you to have a consultation with a surgeon, the Piedmont Surgical Clinic surgeons are here for you, with experience, surgical expertise and personal, compassionate care.
